Greenseeder Hand Planter

Increased Yields and Improved Safety for Developing World Producers

Almost the same amount of maize (corn) mechanically produced in the USA is planted, managed, and harvested by hand in the developing world. This is 29,400,000 ha (72,618,000 ac) of maize produced on marginal landscapes like the one in El Salvador (left). Central America has 3,000,000 ha (7,400,000 ac) of hand planted maize. Planting is accomplished using heavy sticks whereby 2-3 seeds are planted per strike, roughly 35cm (14in) apart. This method of planting is common for subsistence maize farmers, largely dictated by terrain, and circumstance.

When single seeds are placed 14-17cm apart (6 to 7 in), much like

conventional planters, production levels can increase 25%. Because developing world maize yields hover near 2 Mg/ha (30 bushels/ac), a 25% yield increase (+0.5 Mg/ha) on 60% of the hand planted maize area in the developing world is worth more than 3 billion USD per year.

The Greenseeder hand planter is similar in shape, size, and weight (1.4 kg or 3 lb) to planters currently used, but that can reliably singulate seed. The woman in Uganda (right) really liked the new planter but wanted

improvements in the tip.

Benefits

production

• Remove chemically treated seeds from the hands of producers

Greenseeder planter used near Lira,

Uganda for maize

Commercial production initiated for Greenseeder planters

World Values (2014) World maize ha's, 184,000,000 (454,000,000 ac)

Decreased soil erosion from improved plant spacing

Place urea below the surface reducing NH3 losses
Planter technology for all kinds of planted crops/seeds

Significant increases in developing world maize

• Accommodate mid-season applications of urea-N fertilizer

Developing world maize ha's, 49,356,000 (121,909,000 ac) f total) 29,400,000 ha's (72,618,000 ac)

Developing world maize <u>planted by hand</u> (60% of total) 29,400,000 ha's (72,618,000 ac) 25% increase on world hand planted maize (avg 2 Mg/ha *0.25 = 0.5 Mg/ha) 29,400,000*(2000kg/ha*0.25%)*\$0.23/kg (or \$6.00/bu)= \$3,381,000,000

Pictures are from maize planting in El Salvador using metal tipped persimmon sticks, planting in Uganda using the new Greeenseeder planter, and assembled prototype hand planters
